General Introduction	01
1. Introduction.....	03
2. Web applications.....	03
2.1. 3-tier Architecture of web application.....	03
2.2. Web application security.....	04
2.2.1. SQL Injection.....	04
2.2.2. Cross Site Scripting (XSS).....	04
2.2.3. Broken Authentication and Session Management.....	04
2.2.4. Insecure Direct Object References.....	04
2.2.5. Cross Site Request Forgery (CSRF).....	05
2.2.6. Security Misconfiguration.....	05
2.2.7. Failure to Restrict URL Access.....	05
2.2.8. Invalidated Redirects and Forwards.....	05
2.2.9. Insecure Cryptographic Storage.....	05
2.2.10. Insufficient Transport Layer Protection.....	05
3. SQL injection.....	06
3.1. SQL injection Definition.....	06
3.2. Consequence of SQL injection.....	06
4. The SQL injection mechanisms.....	07
4.1. Parameter tampering.....	07
4.2. URL tampering.....	07
4.3. Cookie poisoning.....	08
4.4. Hidden field manipulation.....	08
4.5. HTTP header manipulation.....	09
5. SQL injection attack types.....	10
5.1. Tautologies.....	10
5.2. Logically incorrect queries.....	10
5.3. Union Query.....	10
5.4. Blind injection.....	11
5.5. piggy-backed queries.....	12
5.6. Stored procedure.....	12

5.7. Timing attacks.....	13
6. SQL injection prevention mechanism.....	13
6.1. Defensive coding practices.....	13
6.1.1. Input type checking.....	13
6.1.2. Encoding of inputs.....	13
6.1.3. Positive pattern matching.....	14
6.1.4. Identification of all input points.....	14
6.2. Black box testing.....	14
6.3. White box testing.....	14
6.4. Run time monitoring (control)	14
7. Existing solutions.....	14
7.1. Proxy filtering.....	14
7.2. AMNESIA.....	15
7.3. Client side validation.....	16
8. Conclusion.....	16
1. Introduction.....	17
2. Definition.....	17
3. basic Terminology.....	18
4. Functionality of work cryptography.....	18
5. Encryption and decryption.....	18
6. Common goals of cryptography.....	19
6.1. Message confidentiality.....	19
6.2. Message integrity.....	19
6.3. Authentication.....	19
6.4. Non-repudiation.....	19
7. Keys.....	19
8. Hash functions.....	20
8.1. Defintion.....	20
8.2. The hash function properties.....	21
8.3.1. Password Hashing.....	21
9. Digital signatuers.....	22
10. symmetric cryptography.....	23

10.1. Key Management.....	24
10.1.1. Static (or long-term) Keys.....	25
10.1.2. Ephemeral, or Session (or short-term) Keys.....	25
11.Public key cryptography.....	25
11.1. The RSA cryptosystem.....	25
11.1.1. The RSA encryption.....	26
11.1.2.The RSA decryption.....	26
11.1.3. The RSA signature.....	26
11.1.4. The RSA signature verifying.....	26
11.2. ECC cryptosystem.....	27
11.2.1. ECC encryptions/ decryption.....	28
11.2.2. Signature generation.....	28
11.2.3. Signature verification	28
11.3. The Elgamal cryptosystem.....	29
11.3.1.DL - discrete logarithm problem.....	29
11.3.2. Elgamel encryption.....	29
11.3.3.Elgamel decryption.....	30
11.3.4.Elgamel signature.....	30
11.3.5.Elgamal signature verification.....	30
Conclusion.....	30
3.2.1.1. ConProvider.....	31
1. Introduction.....	31
2. Existing solutions to preventing SQL injection use cryptography system.....	31
2.1. Mixture Secure Hashing technique and Advanced Encryption Standard (AES)....	31
2.1.1. Login phase.....	31
2.2. Preventing SQL injection attacks using Blowfish and RSA.....	32
2.2.1. Access Request Process.....	32
2.2.1.1. Registration.....	32
2.2.1.2. Login.....	33
2.2.2. Access grant process.....	34
2.3. Preventing SQL injection attacks using Multi-hashing.....	35
2.3.1. definition	35
2.3.2. Registration phase.....	35

2.3.2.1.First hash code.....	35
2.3.2.2.Second hash code.....	35
2.3.3. login phase.....	36
2.3.4. validation phase.....	36
2.4. Random algorithm.....	37
Conclusion.....	38

6.Conclusion.....	49
General Conclusion.....	50

General Introduction

Web applications are everywhere on the Internet. Almost everything you do online is done through a web application whether you know it or not. They come in the form of web-based email, forums..., it is important to understand that these types of websites are all database driven.

Databases are a principal element of web applications because they are able to store user's preferences, personal identifiable information, and other sensitive user information. Web applications interact with databases to dynamically build customized content for each user, the web application communicates with the database using structured query language (SQL).

SQL is a programming language for managing databases that allows you to read and manipulate data in MySQL, SQL Server, Access, Oracle, and other database systems, the relationship between the web application and the database is commonly abused by attackers through SQL injection.

The SQL injection is a type of injection attack in which SQL commands are supplied (provided) in the user-input variables, such as a web form entry field, in a try to trick the web application into executing the attacker's code on the database.

The results of SQLI (SQL injection) can be disastrous because the successful SQL injection can read sensitive data from the database, modify database data (insert/update/delete), execute administrative operations on the DB, recover the contents on the DBMS file system.

There is a lot of approach that assistance to protect web and preventing SQL injection, but not all this technique offer the same levels of security, so had better to select best technique which help us to protect personal information against hackers, we think the approach that rely on cryptography system gives more security compared to other strategies.

In our project, we present the implementation of a novel idea to prevent SQL injection, which relies on a cryptography system, where we use effective cryptography system (public key cryptography) to build a strong digital signature, hence access to a novel mechanism that helps to offer more a secure web application, we also explain the Random encryption algorithm and use it in our application.

The goals of this work

The objective of the work entitled «**implementation of a cryptography system to prevent a SQL injection** » is to give a maximum security to protect the web application against SQL injections, we can summarize our work in the following steps:

- ✓ Explain the SQL injection vulnerability
- ✓ Study and analyse some public-key cryptosystems and digital signatures
- ✓ Discuss about existing solutions that are based on a cryptography system.
- ✓ Implement digital signature on the web application to prevent a SQL injection.

Research paper outline

Our research paper is divided into four chapters:

- ✓ The first chapter presents the definition of the SQL injection and the SQLI mechanism and different kinds of SQLI which are used by the hackers to avoid security of web application. We also explain some strategies to prevent and detect a SQL injection.
- ✓ The second chapter studies some public-key cryptography systems like (RSA, Elgamal, NTRU, ECC...). We also attempt to clarify the principal roles of digital signatures and the hashing secure technique.
- ✓ The third chapter deals with the existing techniques to prevent a SQL injection, which uses a cryptography system.
- ✓ The fourth chapter discusses the implementation of some public-key cryptosystems to prevent a SQL injection, the implementation of a digital signature to make authentication.

General Conclusion:

A SQL injection is one of the most important web security threats that needs attention so as to improve security for the users and their data. In this dissertation, we showed the security techniques used to secure web applications against a SQL injection, hence protect sensitive data from hackers. These security techniques have problems and do not ensure the necessary security rules. There are some techniques which offer less security compared to others.

The cryptographic techniques are the most interesting tools to prevent SQL injections. We presented in our work the basic rules of public-key cryptosystems like encryption, decryption, digital signature, and we showed how we can use public-key cryptography to ensure security of web application through use digital signature .

We also presented an authentication scheme for preventing SQL Injection attacks using ECC and RSA. Signing username and password are used to improve the authentication process, and avoid to deal with natural input. Our strategy relies on random, algorithm based on randomization and used to convert the input into a cipher text. For any input in the registration phase, we apply the random (ECC, RSA).

Future perspectives

In this work, I have concentrated on the particular kind of a SQL injection. I think that this kind needs more research, mainly because of various reasons: SQL injection attacks are most probable to change and new vulnerabilities will be found, collectively with new countermeasures to deal with them. As many hacking sites exist on the web, and since attack methods are well described and circulated between hackers, we believe that information about new attack methods must be constantly surveyed and new counter measures should be developed. As future recommendations, we had better adjust some points that are explained below:

- ✓ Use another cryptography algorithm that maybe better in the future compared to algorithms that were used in our application.
- ✓ Find another way to reduce time consumed during the login process
- ✓ In the future, I will try to develop a technique that enables total prevention against other kinds of SQL Injection Attacks.
- ✓ Also, we can added other cryptography algorithm to our strategy, that mean became use 3 or 4 algorithm in **Random** function.

الملخص

مع تزايد خدمات وحجم استعمال الانترنت في العالم تزايدت معه التهديدات و الخروقات الأمنية بشكل كبير، من بين نقاط ضعف تطبيقات الويب والأكثر خطورة هي حقن SQL الخبيثة حيث بمجرد إدخال هذه التعليمات الخبيثة تتسبب في استعراض شامل لبيانات سرية.

لذا فان الهدف من هذه المذكرة هو إيجاد الطريقة المثلى لحماية تطبيقات الويب والبيانات الحساسة من المهاجمين والخروقات الأمنية عن طريق استخدام أنظمة التشفير الفعالة التي توفر بدورها درجة حماية كبيرة لتطبيقات الويب حيث قمنا بدراسة شاملة حول مختلف الاستراتيجيات التي تعتمد على التشفير في مضمونها وأمثلها كما تطرقنا إلى ما يسمى بالإمضاء الالكتروني ودوره الفعال في حماية البيانات حيث طبقنا بعض خوارزميات التشفير مثل RSA ECC، أيضا شرح بعض التقنيات المستخدمة لحماية ومنع الاستفسارات الملوثة التي يتم إدخالها من طرف المهاجم.

كلمات دلالية: PHPMyadmin ، Elgmal، NTRU، SQLI، SQL، RSA، ECC

Abstract

With the spread of Internet use in the world, security threats in the Internet increased dramatically. Among the vulnerabilities of the web application is SQL injection, which is based on the insertion of malicious requests to the DBMS, which executes these requests denying access to sensitive and confidential data.

The purpose of this research paper is to find the best way to protect Web applications and sensitive data against hackers and security breaches through the use of effective encryption systems which, in turn, provide a significant degree of protection for Web applications. We made a thorough study of the different optimal strategies based on encryption in their content. We dealt with the e-Signature and its effective role in the protection of data. We applied encryption algorithms such as ECC, NTRU and some of the techniques used to protect and prevent contaminated queries that are entered by the attacker.

Keys words: ECC, RSA, SQL, SQLI, NTRU, Elgmal, PHPMyadmin.

Résumé

Avec l'augmentation et la propagation de l'utilisation de l'internet dans le monde, les menaces de sécurité dans d'Internet ont augmenté de façon spectaculaire. Parmi les points vulnérables de ces applications web c'est l'injection SQL, qui se base sur l'insertion des requêtes malveillantes vers SGBD. Ce dernier exécute ces requêtes ce qui lui permet d'accéder à des données sensibles et confidentielles.

Le but de ce mémoire est de trouver la meilleure façon de protéger les applications Web et les données sensibles contre les pirates et les failles de sécurité par l'utilisation des systèmes de cryptage efficaces qui, à leur tour, offrent un degré important de protection pour les applications Web. Nous avons fait une étude approfondie sur les différentes stratégies optimales qui se basent sur le chiffrement dans leur contenu. Nous avons mentionné l'e-Signature et son rôle efficace dans la protection des données. Nous avons également appliqué des algorithmes de chiffrement tels que ECC, RSA nous avons aussi expliqué quelques techniques utilisées pour protéger et prévenir les contaminées qui ont été entrées par l'attaquant.

Mots clés: ECC, RSA, SQL, SQLI, NTRU, Elgmal, PHPMyadmin.
